Stephanie:

According to WW, most fish need to be cut open to determine gender since these fish were going to be used for tissue analyses, none were cut open. So gender was listed as indeterminant.

**Subject:** Background tissue samples....

Hi Rob,

Could you send us the lat/long for each of the background tissues sampling locations? Also, the sex of most fish is listed as indeterminate in the tables. Do you have the sex information and was it not entered into the table, or has it really not been determined? If you have it, please send that too.

Thanks,  
Stephanie
